

# **CONFIGURATION FLEXIBILITY AND ROBUSTNESS**

Neil Pomphrey for the NCSX team

NCSX Conceptual Design Review  
May 21-23, 2002

Princeton Plasma Physics Laboratory

## OUTLINE

To achieve the science goals of the NCSX mission, the coils must be capable of supporting a wide range of variations in plasma configuration about the reference baseline equilibrium.

- **Numerical experiments demonstrate the flexibility of NCSX coils to support such configuration variations, and demonstrate the robustness of performance of NCSX plasmas for substantial variations about reference design values of plasma current, beta, and profile shape.**

# NCSX COILS FOR FLEXIBILITY ANALYSIS

- 18 modular coil currents in 3 independent groups (M1 - 3)
- 6 axisymmetric poloidal field coils (4 circuits PF3 – 6 provide shaping fields)
- 18 auxiliary TF coils (1 circuit) providing  $1/R$  field  $\pm 0.5$  T
- **Coil current limits provided by the engineers – to be satisfied in flexibility runs**

## PLASMA PERFORMANCE AS $\beta$ AND $I_p$ ARE VARIED ( $B_T = 1.7$ T)

- Using reference bootstrap-consistent profiles of  $p(s)$  and J.B(s) coil currents were varied to produce stable configurations over a wide range of  $I_p$  and  $\beta$ , spanning  $I_p \in [0, 174$  kA],  $\beta \in [0, 4\%]$ . The calculated variation in QA-ness measure  $\varepsilon_h$  is less than a factor of 2 compared with the reference S3 value 0.45%.
- For these un-optimized profiles, stable configurations were also found at  $I_p = 174$  kA,  $\beta = 5.0\%$  and  $I_p = 174$  kA,  $\beta = 6.0\%$ .
- Configurations with low  $\beta$ -limits (e.g.,  $\beta \sim 1\%$ ) are easily dialled by an appropriate choice of coil currents.

## COIL CURRENTS FOR $I_p - \beta$ SCAN

Coil Currents for reference S3 configuration ( $\beta = 4.2\%$ ):

M 1 [kA-turns]	M 2 [kA-turns]	M 3 [kA-turns]	TF [kA-turns]	PF3 [kA-turns]	PF4 [kA-turns]	PF5 [kA-turns]	PF6 [kA-turns]
694.2	654.6	551.1	27.8	1524.2	1180.0	95.2	-2.3

Coil current variation over entire  $I_p - \beta$  scan: Each column shows max +/- variation

$\Delta I_{M1}$ [kA-turns]	$\Delta I_{M2}$ [kA-turns]	$\Delta I_{M3}$ [kA-turns]	$\Delta I_{TF}$ [kA-turns]	$\Delta I_{PF3}$ [kA-turns]	$\Delta I_{PF4}$ [kA-turns]	$\Delta I_{PF5}$ [kA-turns]	$\Delta I_{PF6}$ [kA-turns]
+52.	+41.	+46.	+31.	+0.	+0.	+78.	+28.
-38.	-12.	-27.	-46.	-1691.	-1627.	-222.	-36.

- **Modular coil currents vary  $< \pm 10\%$  over the  $I_p - \beta$  plane,**  
 **$B_T^{Aux}$  varies  $< \pm 0.10$  T, PF currents vary  $\sim 100\%$  but within allowables.**

# PLASMA PERFORMANCE AS PROFILES ARE VARIED

## Question:

- What happens to plasma performance ( $\beta$ -limits, QA measure  $\varepsilon_h$ ) when plasma profiles are varied about reference forms at fixed  $I_p$ ,  $B_T$ ?
- Is the reference configuration sitting atop a pinhead optimum so that as the profiles are varied the performance drops precipitously?

## Answer:

- **NO!** – We find configurations with a wide range of current and pressure profiles which have  $\beta$ -limits in excess of 3.0% and which have good QA.

# CURRENT PROFILE VARIATION IN CORE AND EDGE

\*M.I. Mikhailov, V.D. Shafranov  
 "Stable Current Profile in a Stellarator with Shear"  
 Nucl. Fusion **30**, 413-421 (1990)

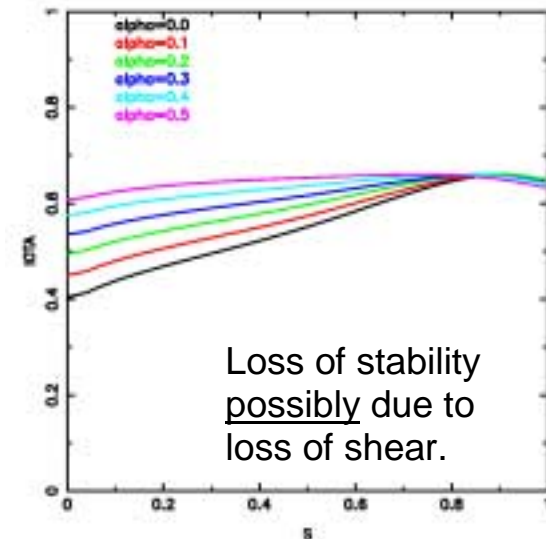

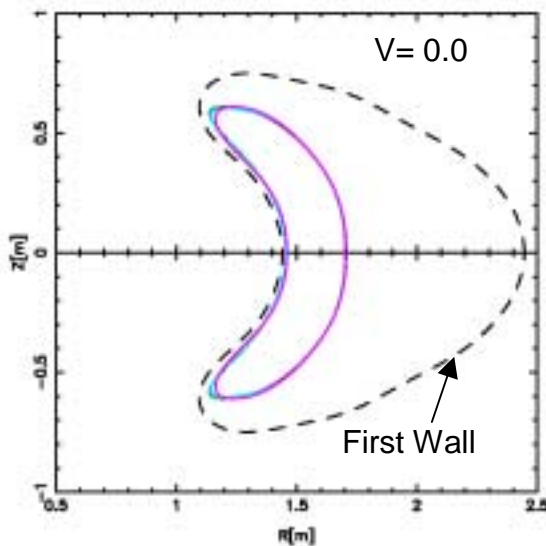

- Using the reference  $p(s)$ , and  $I_p = -174$  kA,  $B_T = 1.7$ T, for what range of J.B profiles can we find stable configurations with  $\beta \geq 3.0\%$ ?
- Profiles with  $0 \leq \alpha \leq 0.5$  are stable at  $\beta = 3.0\%$ . Stable configs have  $\varepsilon_h \leq 0.5\%$  at  $s=0.5$
- Finite edge current density appears to be stabilizing\*. Using the profile shown ( $J.B^{\text{edge}}/J.B^{\text{max}} = 0.5$ ) a stable configuration using S3 coil currents was found at  $\beta = 5\%$ !
- H-mode profiles may be beneficial to NCSX stability (contrast with tokamaks).

# COIL CURRENTS FOR CURRENT PROFILE SCAN

Each column shows max +/- variation relative to current required to support  $\alpha = 0.0$  state

$\Delta I_{M1}$ [kA-turns]	$\Delta I_{M2}$ [kA-turns]	$\Delta I_{M3}$ [kA-turns]	$\Delta I_{TF}$ [kA-turns]	$\Delta I_{PF3}$ [kA-turns]	$\Delta I_{PF4}$ [kA-turns]	$\Delta I_{PF5}$ [kA-turns]	$\Delta I_{PF6}$ [kA-turns]
+26.	+5.	+3.	+4.	+0.	+0.	+8.	+1.
-4.	-4.	-1.	-1.	-8.	-168.	-0.	-0.

- coil current changes are small --> small change in plasma shape

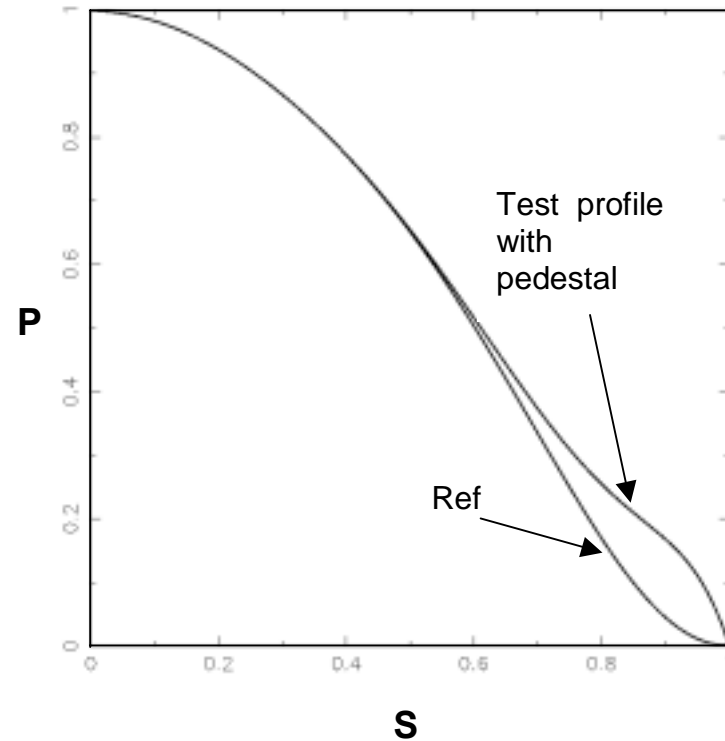

# PRESSURE PROFILE VARIATION ( $\beta = 3.0\%$ )

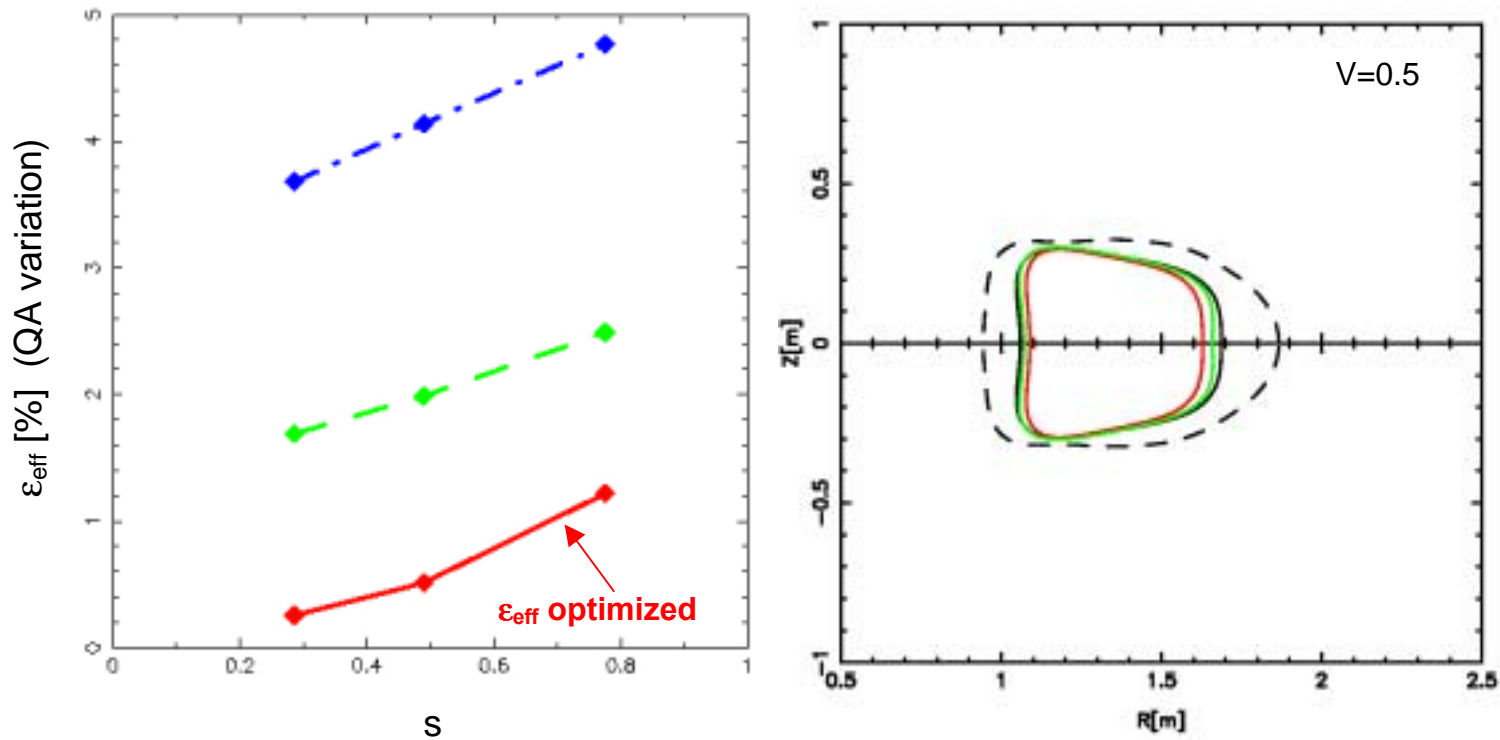

- Stable configurations at  $\beta = 3.0\%$  found for  $0 \leq \gamma \leq 0.8$  i.e., includes peaked profiles ( $\gamma = 1.0$  was stable at  $\beta = 2.5\%$ ).

- Pressure profile with finite edge gradient shown above was stable at  $\beta = 4.0\%$  for  $I_p = 174$  kA,  $B_T = 1.7$  T.

## FLEXIBILITY TO VARY QA-NESS

(configs here have  $I_p = -87.5$  kA,  $\beta = 2.0\%$ )

Difference in coil currents between the **high** and **low**  $\epsilon_{\text{eff}}$  configs shown

$\Delta I_{M1}$ [kA-turns]	$\Delta I_{M2}$ [kA-turns]	$\Delta I_{M3}$ [kA-turns]	$\Delta I_{TF}$ [kA-turns]	$\Delta I_{PF3}$ [kA-turns]	$\Delta I_{PF4}$ [kA-turns]	$\Delta I_{PF5}$ [kA-turns]	$\Delta I_{PF6}$ [kA-turns]
-111.	-38.	+145.	+0.	+0.	-7.	-2.	+0.

# FLEXIBILITY TO CONTROL EXTERNAL TRANSFORM

(a) variation at constant shear ( $I_p = 174$  kA,  $B_T = 1.7$  T)

Substantial changes  $\Delta I(s) \in [-0.2, +0.1]$  relative to the baseline S3 state are possible

$\Delta I(s)$	$\epsilon_{\text{eff}}(s=0.5)$	$\Delta I_{M1}$ [kA-turns]	$\Delta I_{M2}$ [kA-turns]	$\Delta I_{M3}$ [kA-turns]	$\Delta I_{TF}$ [kA-turns]	$\Delta I_{PF3}$ [kA-turns]	$\Delta I_{PF4}$ [kA-turns]	$\Delta I_{PF5}$ [kA-turns]	$\Delta I_{PF6}$ [kA-turns]
+0.1	0.5%	+65.	+60.	+75.	-67.	0.	-1021.	+113.	+1.
-0.1	0.7%	-78.	-61.	-66.	+73.	0.	-393.	-33.	+0.
-0.2	1.6%	-181.	-157.	-161.	+167.	-1684.	-947.	-40.	+7.

NOTE SUBSTANTIAL CHANGES IN MAGNETIC AXIS:  $R_{\text{mag}}[m] = 1.447 + 0.119 \cos v$ ,  $Z_{\text{mag}}[m] = -0.065 \sin v$   
 $R_{\text{mag}}[m] = 1.566 + 0.053 \cos v$ ,  $Z_{\text{mag}}[m] = -0.014 \sin v$

# FLEXIBILITY TO CONTROL EXTERNAL TRANSFORM

## (b) variation at constant $\iota(0)$ – changing the shear

Range of shear accommodated by the coils is  $\int = (\iota_{\max} - \iota_0)/s_{\max} = 0.23 \rightarrow 0.53$

$\Delta\iota(1)$	$\Delta I_{M1}$ [kA-turns]	$\Delta I_{M2}$ [kA-turns]	$\Delta I_{M3}$ [kA-turns]	$\Delta I_{TF}$ [kA-turns]	$\Delta I_{PF3}$ [kA-turns]	$\Delta I_{PF4}$ [kA-turns]	$\Delta I_{PF5}$ [kA-turns]	$\Delta I_{PF6}$ [kA-turns]
-0.07	-218.	+309.	-139.	+15.	0.	-1161.	+68.	+0.
+0.1	+40.	+20.	-13.	-19.	0.	-617.	-35.	+0.
+0.2	+64.	+1.	+17.	-29.	0.	-1219.	-94.	-2.

## SUMMARY

- The performance ( $\beta$ -limits QA-ness measure  $\epsilon_{\text{eff}}$ ) of NCSX plasmas produced by the M45 coils is robust w.r.t. substantial variations of  $I_p$  and profile shapes about reference design values.
- The NCSX coil system has considerable flexibility to support the wide range of experiments required by the NCSX mission.

# SUPPLEMENT

## I<sub>p</sub> - β SCAN RESULTS (B<sub>T</sub> = 1.7 T)

- For a 5x5 matrix of equally spaced I<sub>p</sub>, β values spanning I<sub>p</sub> ∈ [0, 174 kA], β ∈ [0, 4%], vary coil currents to seek stable configurations with optimized ε<sub>h</sub>.

β ∈

β[%] →

	0.0	1.0	2.0	3.0	4.0
0.	ε <sub>h</sub> = 0.82% S1	ε <sub>h</sub> = 0.89%	ε <sub>h</sub> = 0.79%	X	X
-44.	ε <sub>h</sub> = 0.77%	ε <sub>h</sub> = 0.68%	ε <sub>h</sub> = 0.67%	ε <sub>h</sub> = 0.61%	ε <sub>h</sub> = 0.72%
-87.5	ε <sub>h</sub> = 0.71%	ε <sub>h</sub> = 0.65%	ε <sub>h</sub> = 0.51%	ε <sub>h</sub> = 0.72%	ε <sub>h</sub> = 0.60%
-131.	ε <sub>h</sub> = 0.52%	ε <sub>h</sub> = 0.46%	ε <sub>h</sub> = 0.42%	ε <sub>h</sub> = 0.41%	ε <sub>h</sub> = 0.45%
-174.	ε <sub>h</sub> = 0.37%	ε <sub>h</sub> = 0.39%	ε <sub>h</sub> = 0.36%	ε <sub>h</sub> = 0.40%	ε <sub>h</sub> = 0.45% S3

I<sub>p</sub>[kA]  
↓

- ε<sub>h</sub> < 1% at s = 0.5 over the matrix (i.e., QA is good)
- Each configuration shown is marginally stable at the given I<sub>p</sub>, β  
=>configs with low β-limits are easily dialled

Stable configs were also found at  
I<sub>p</sub>= -174 kA, β=5.0%  
I<sub>p</sub>= -174 kA, β=6.0%

# REFERENCE PROFILES OF PRESSURE AND CURRENT (USED IN $I_p - \beta$ SCAN)

# PLASMA SHAPES AND $\iota(s)$ PROFILES FOR $I_p$ - $\beta$ SCAN

- Note wide range of iota profiles (shear and edge iota values) for which stable plasmas are found.

## ROBUSTNESS OF EQUILIBRIA

- Begin with reference S3 equilibrium, supported by coil currents  $\{I_j\}$

- Individually perturb each coil current,  $I_j \rightarrow I_j + \Delta I_j$ , where  $\Delta I_j = 0.05 \times I_j^{\max}$
- Calculate new free-boundary equilibrium, compare the new shape with the old reference, and monitor the changes in physics parameters

**Shape and physics properties (stability and QA) are well-preserved  $\Rightarrow$  equilibrium is robust.**

- **Black:** reference S3 equilibrium ( $I_p = -174$ . kA,  $\beta = 4.2\%$ )

- Red:  $I_p = 0$  kA,  $\beta = 0\%$  (post-quench) using S3 coil currents

- $\langle R \rangle = -0.10$  m as result of quench (no limiter assumed for calculation)
  - Dramatically smaller displacement than for a tokamak!

## PLASMA OFFSET 2cm FROM FIRST WALL

(shown in black, compared with reference s3 plasma)

	M 1 [kA-turns]	M 2 [kA-turns]	M 3 [kA-turns]	TF [kA-turns]	PF3 [kA-turns]	PF4 [kA-turns]	PF5 [kA-turns]	PF6 [kA-turns]
Ref S3	694.2	654.6	551.1	27.8	1524.2	1180.0	95.2	-2.3
2cm offset	745.	726.	608.	18.	136.	616.	130.	7.

$A = 4.4 \rightarrow 4.6$ ,  $Vol = 2.90 \rightarrow 2.63 \text{ m}^3$ ,  $\epsilon_{\text{eff}}(s=0.5) = 0.45 \rightarrow 0.41\%$

# FLEXIBILITY TO EXPLORE STABILITY BOUNDARIES AND 3D SHAPE STABILIZATION

- Each stable free-boundary configuration in the  $I_p - \beta$  scan lies at a point of marginal stability w.r.t. kink and ballooning modes for the given profiles.
- To illustrate the type of experiment that can be run on NCSX aimed at understanding the physics that determines stability boundaries, consider two free-boundary configurations from the  $I_p - \beta$  scan:

**C1**

$I_p = -44 \text{ kA}, \beta = 1.0\%$

and

**C3**

$I_p = -44 \text{ kA}, \beta = 3.0\%$

## EXAMPLE OF 3D SHAPE STABILIZATION

- $\beta_{lim} = 1.0\%$  for C1 (black)
- $\beta_{lim} = 3.0\%$  for C3 (red)

Difference in  $\beta$ -limits is due to change in shape.

# $\iota$ -CONTROL CAN REMOVE AMBIGUITY OF $\iota_{\text{edge}}=0.5$ ROLE

- Impose  $\iota$ -control on C1 to produce new configuration, C1-mod, whose  $\beta$ -limit is still 1.0%, but which has the same  $\iota_{\text{edge}}$  as the  $\beta_{\text{lim}} = 3.0\%$  configuration.

(note: the config with the lower  $\beta$ -limit actually has the highest shear!)
