

Modular Coil Winding Form Status

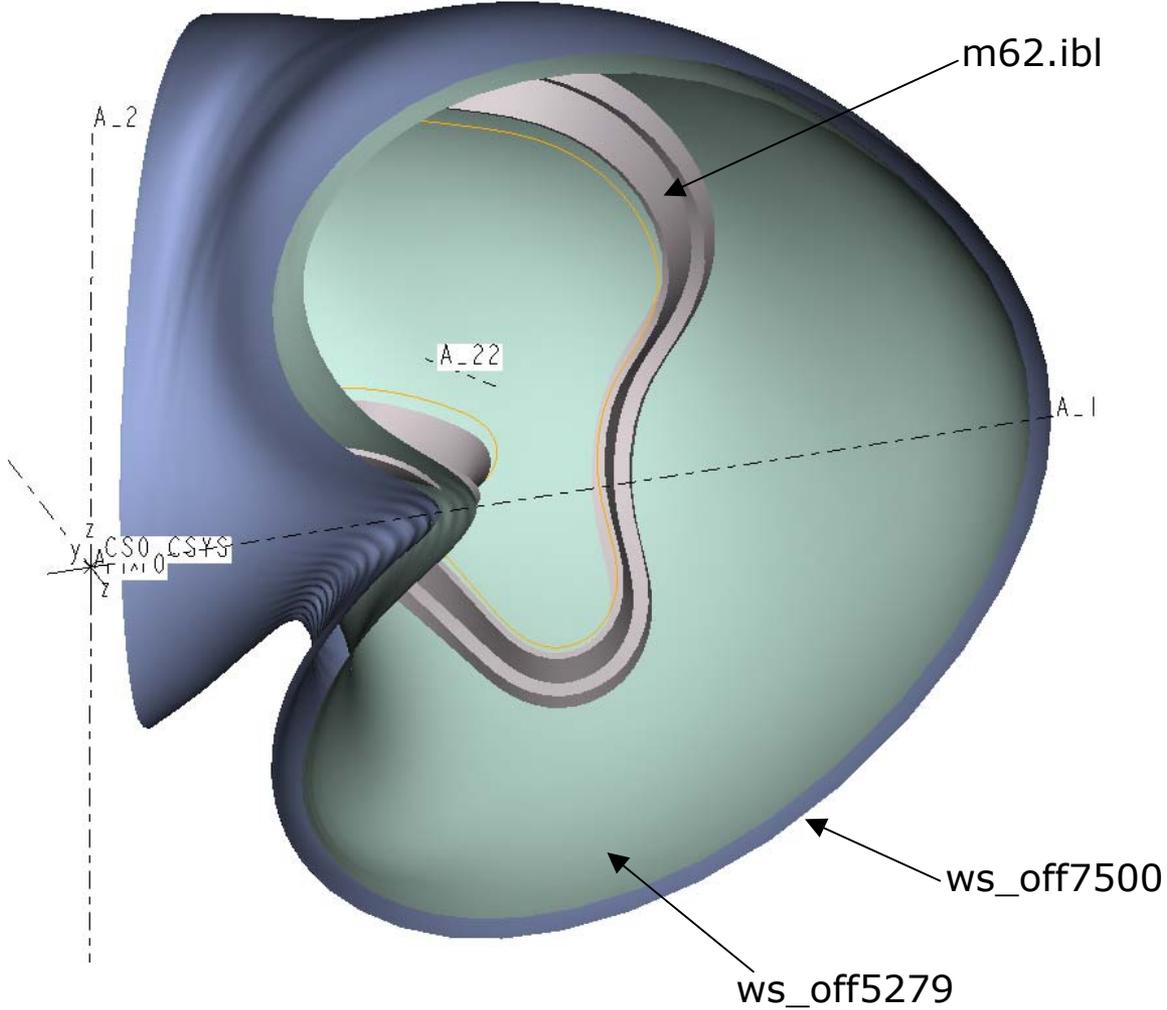

David Williamson
8/25/03

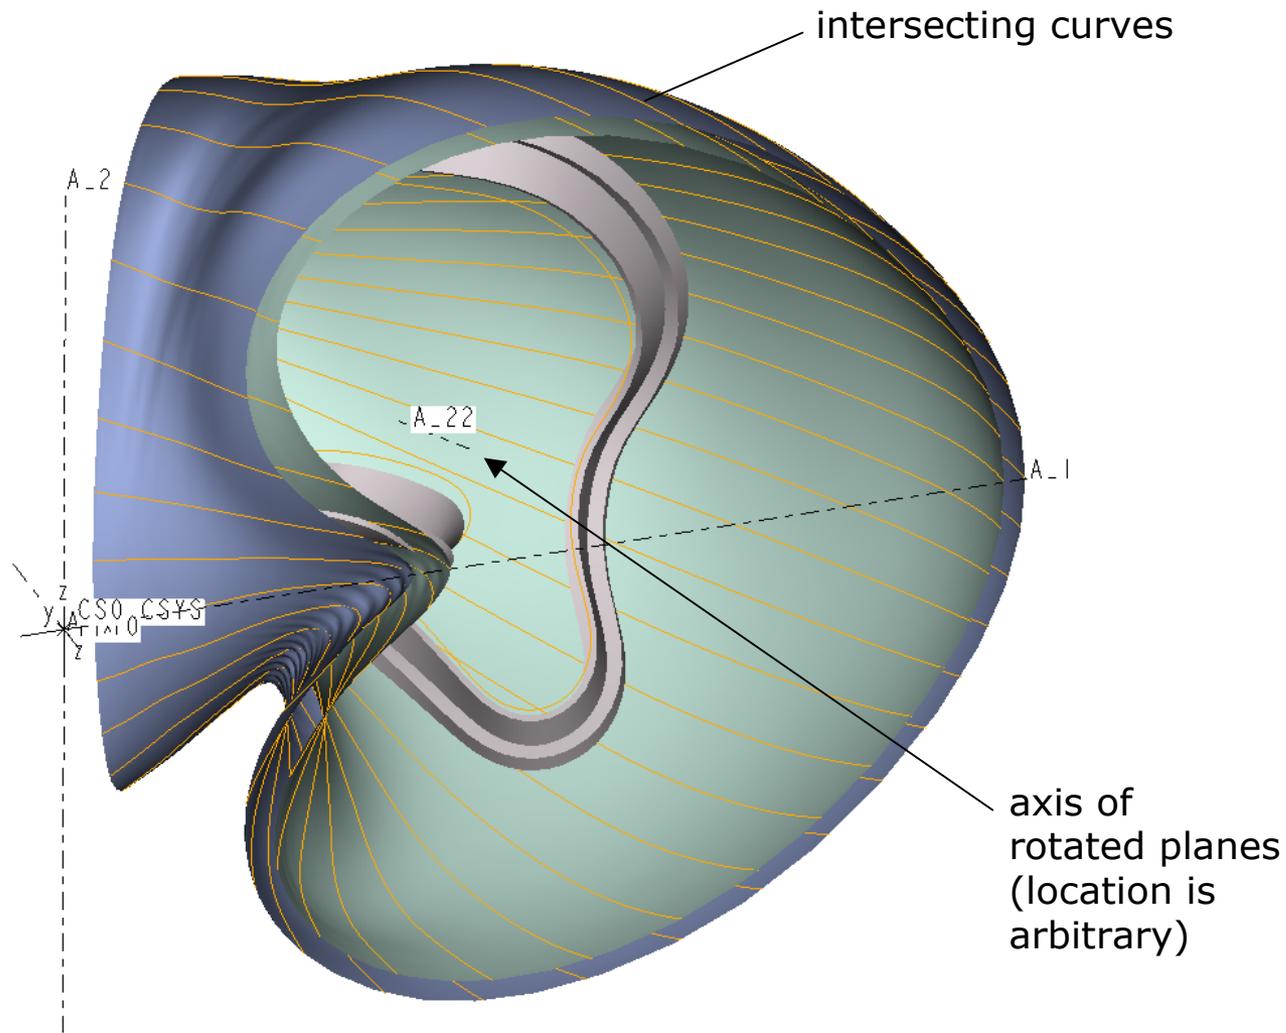

Status

- Method has been developed to address winding form geometry issues:
 - Overlap of tee base
 - Nesting surfaces
 - Wing geometry
- Basic approach is to model a unique inner surface for each shell segment that makes space for the wings of adjacent coils. The outer surface is made by offset/smoothing of inner surface.

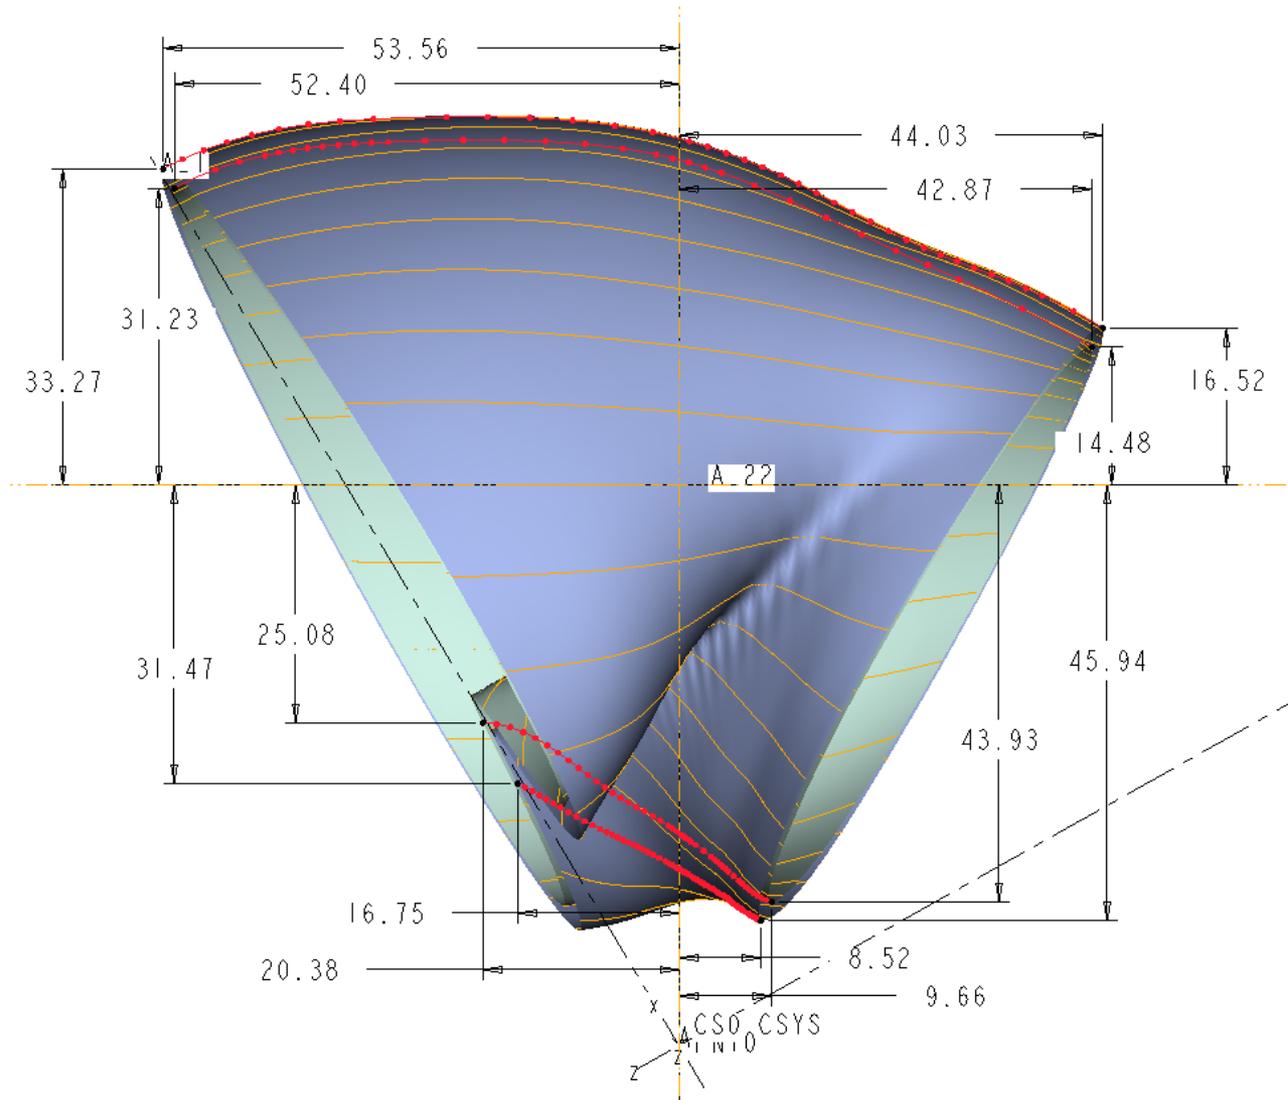

Example: Type B Winding Form

- SHELL72.PRT
- SIDE
- TOP
- FRONT
- DEF_CSYS
- A_2
- A_1
- A_3
- PNT0
- CS0
- WC1
- XV1
- WS_OFF5279
- Cut id 837
- WS_OFF7500
- Cut id 876
- DTM1
- A_22
- Protrusion id 4348
- Cut id 4783
- Insert Here

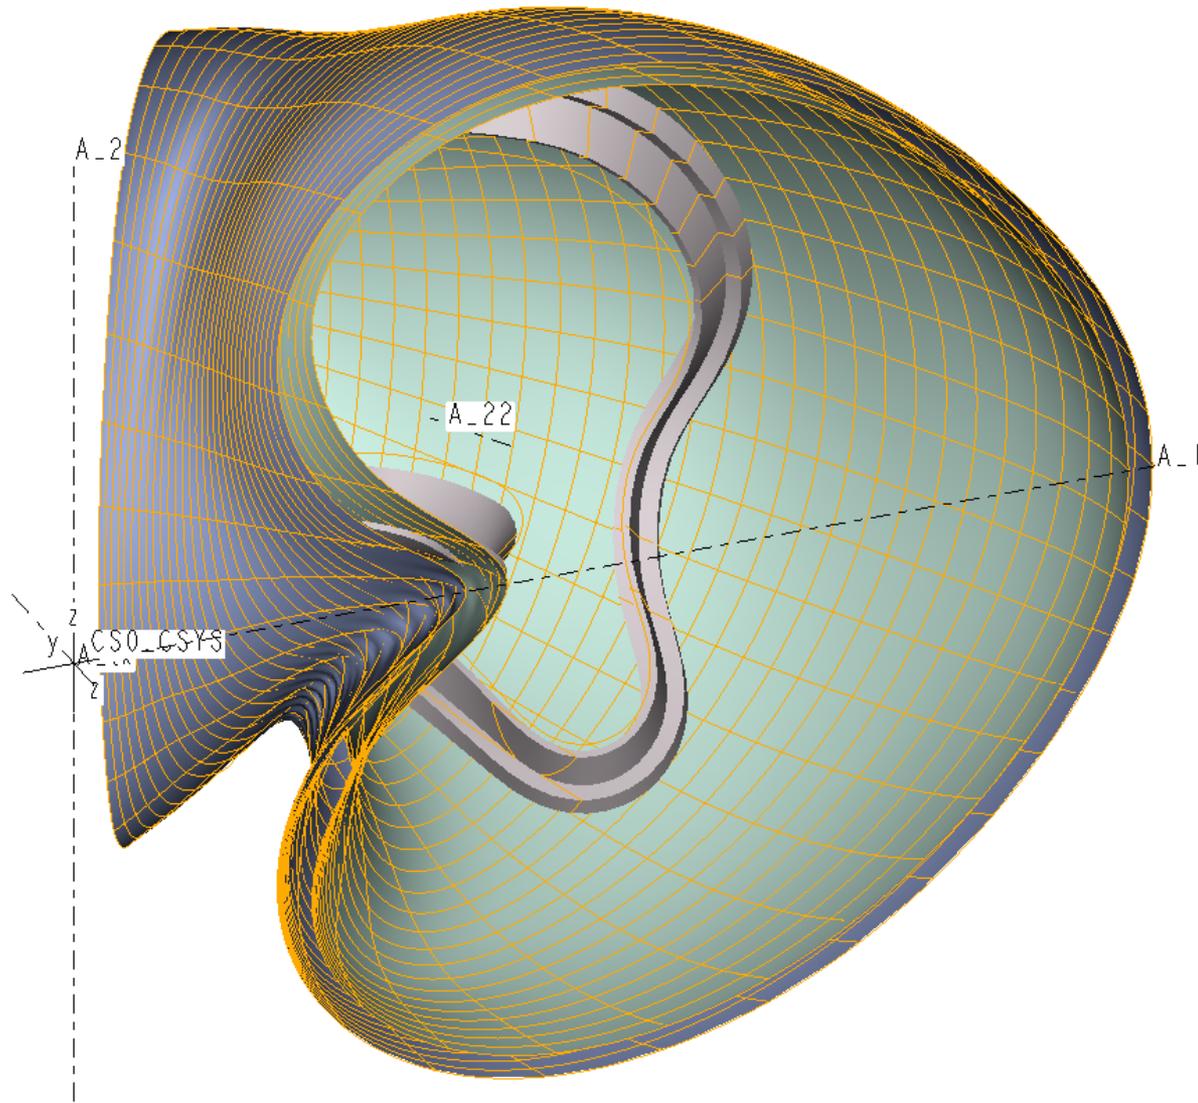

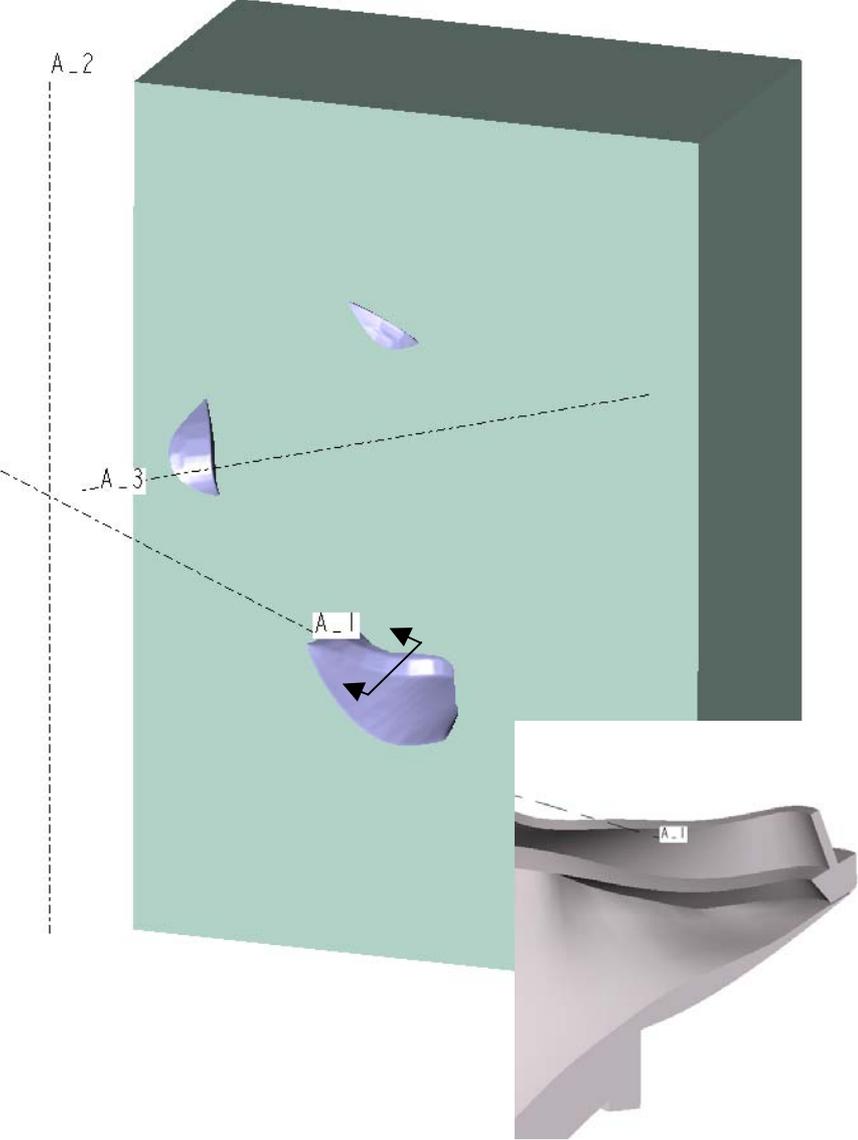

create duplicate spline curves that are independent from starting surface

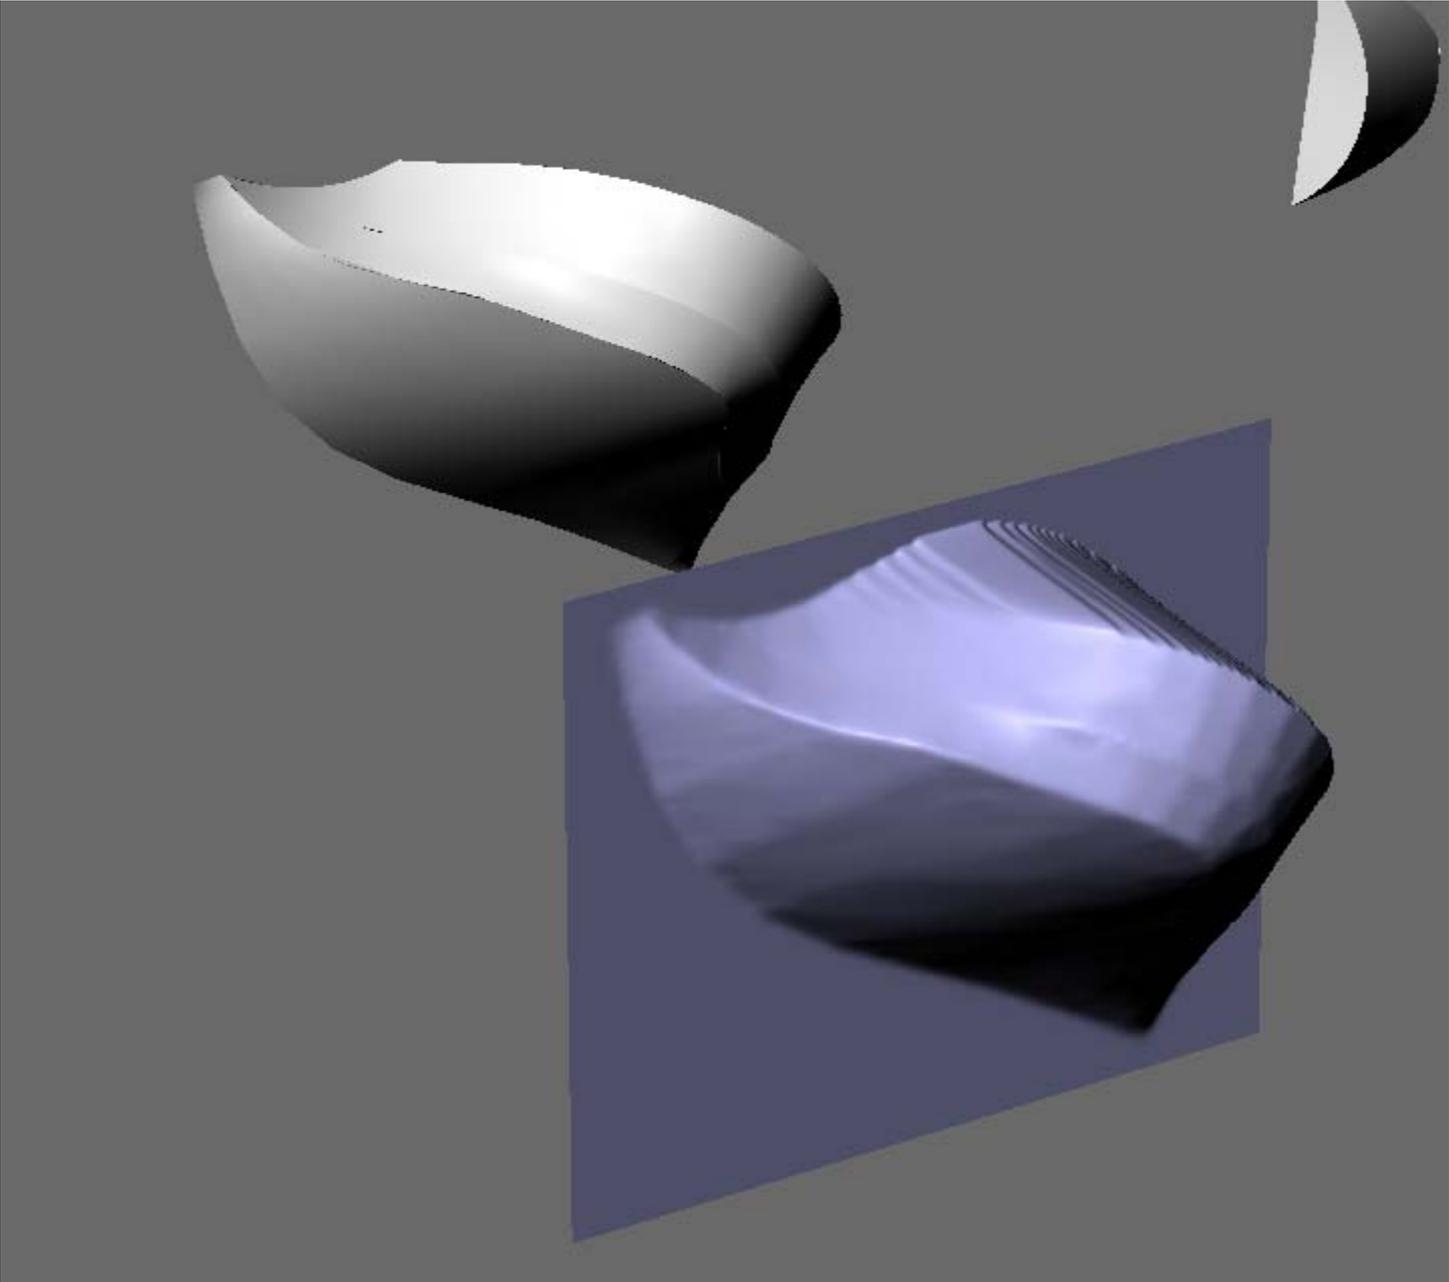

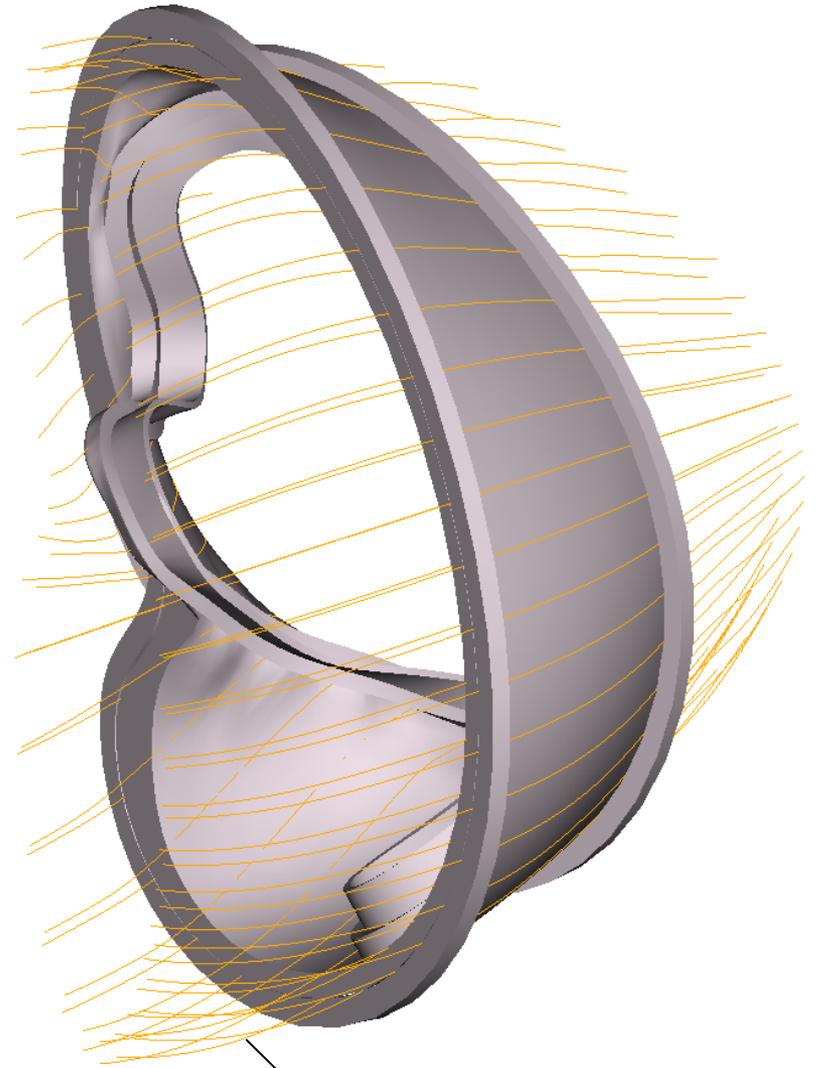

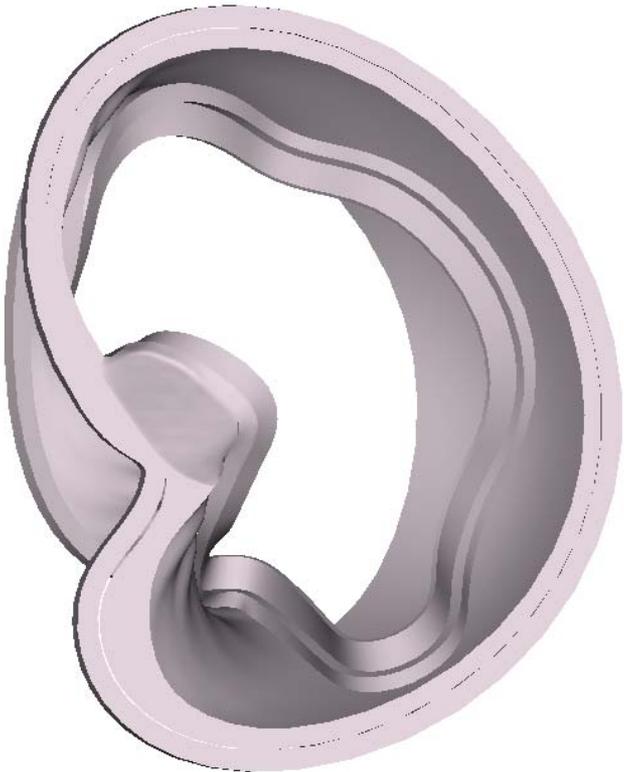

intersect spline curves with radial planes to get 1st dir curves for inner, outer surface

cut with end block leaves wing material and cuts shell back to flange

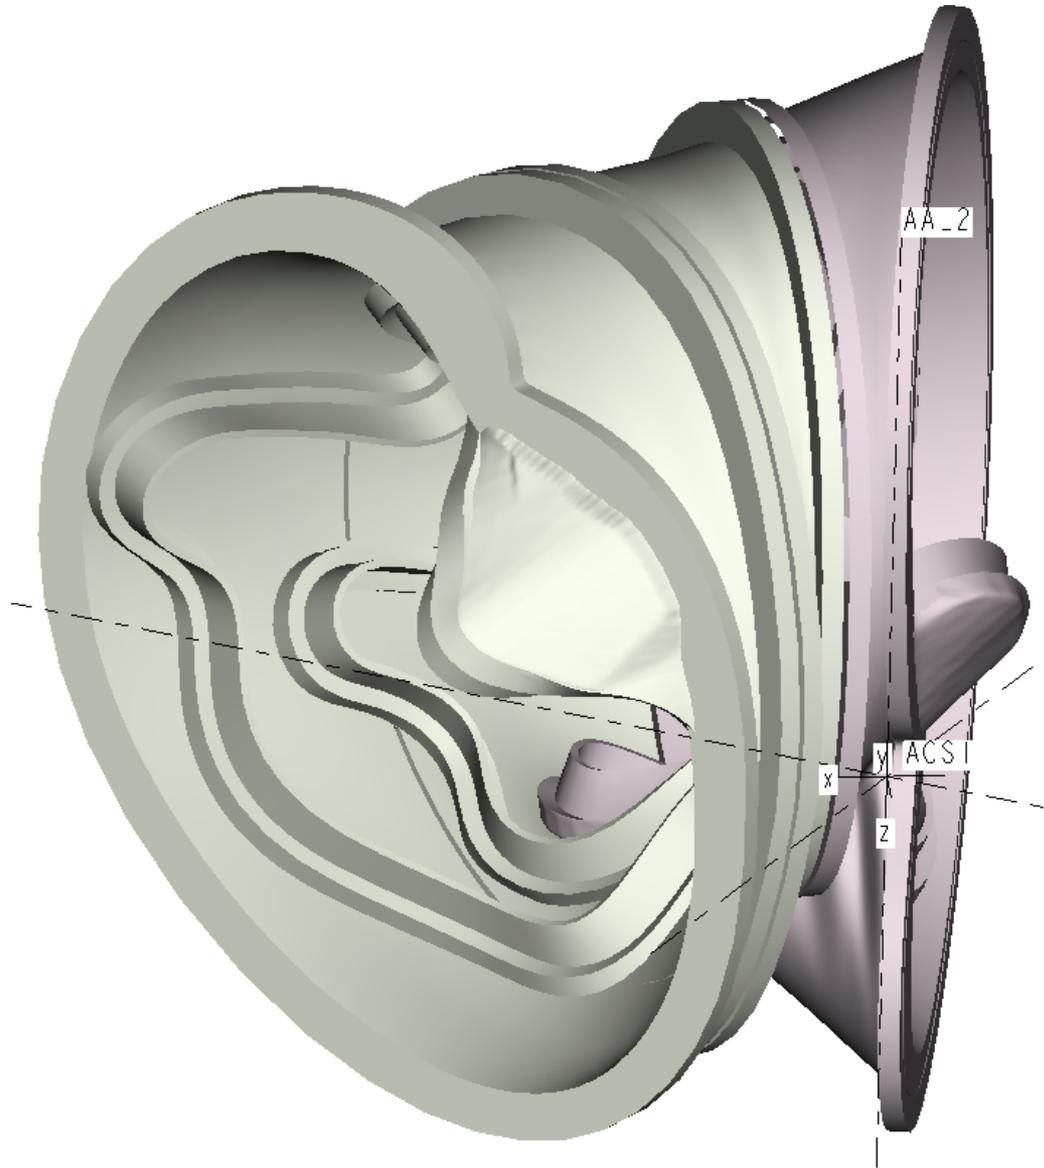

controlling spline curves

Type C Winding Form

Finally discovered how to use Rhino surface tweaking!
Could be used to make initial ProE surface closer to final shape.
