

TO: M. Cole
FROM: P. L. Goranson

SUBJECT: Job 1270 - NCSX Heater Control System Closeout Summary

08July-08-PG

Scope

This effort covers all Title I, II, and III engineering design for a resistance heating temperature control system to maintain the NCSX inner port extension wall temperatures during standby and bake out operation. It includes monitoring of temperatures of the Vacuum Vessel body and the port extensions during standby and bake out operation. It includes transmission of temperature data to Central I & C for archival and interface to other disciplines.

Work includes engineering design, procurement, fabrication, and installation of leads, thermocouple signal conditioners, processors, heater controllers, racks, wire trays, and associated support hardware. Thermocouples and heater tapes are supplied by WBS 12

Status

At the time of closeout no work was in process.

Interfaces

Vacuum Vessel (12)
Cryostat (WBS 17)

Specifications

No work had begun on a system requirements document or CSPEC.

All work to date was included in the SC Project Review of NCSX, April 8-10, 2008 and a presentation by Gernhardt entitled "NCSX Heater and Thermocouple-Instrumentation and Control", updated 10/25/07. (Both Attached).

Schematics

None except in documents listed above.

Models Completed

None required.

Drawings

None started.

Analyses

None required.

Testing

None required. MDL incorporated the design in one of its heating systems for a furnace with good results.

Costs

Cost estimates were updated on the latest WAF and were included in the 08 Lehmann review presentation.

Remaining Work

- The routing of wire trays.
- Locating equipment.
- Drawings and schematics.

R&D was not required.

Conclusion

The work was in a preliminary phase.

NCSX Heater Control System

P. L. Goranson
Work package 1270

Outline

Updated 10/25/07 R. Gernhardt

- Scope
- Requirements
- System Proposed
- Configuration
- Component details
- M&S and Labor cost details
- Total Cost (M&S and Labor)
- Schedule
- Risk and Mitigation

Scope

- Provide resistance heating temperature control system to maintain the NCSX inner **port extension** wall temperatures during standby and bake out operation.
- Monitor temperatures of the **vacuum vessel body and port extensions** during standby and bake out operation.
- Send temperature data to Central I & C for archival and interface to other disciplines.

Requirements-1

Criteria

- Monitor the VV temperature during standby and bake out operation.
- Operation range - room temperature to 375 C
- The leads must be insulated from all structure including VV and Cryostat.
- The signal conditioners must be the isolated type. Additionally, the instrument cabinet will be isolated from ground by insulation and isolation transformers.
- Each heater must be capable of continuous variable operation from 0 - 200 watts.

Interfaces

- Provisions must be provided by WBS 171 for future hookup of additional thermocouples when outer port extensions are added. The interfacing electrical system must be capable of upgrade to accommodate the upgrade.
- WBS 12 will be responsible for overall design of the system including choice and location of components, mounting provisions, lead routing, signal conditioning, and electrical isolation.
- WBS 12 will be responsible for coordination of the thermocouple design with the other interfacing disciplines (WBS 171 and WBS 5).
- For purpose of assigning interface responsibility, the WBS 4 responsibility shall end at the power panel.

Requirements-2

Interface Block Diagram:

System Proposed, page 1

- **Provides for:**
 - **120 Channels of Active Heater Temperature Control Zones**
 - **114 heating control zones (channels) requested.**
 - **282 Channels of Thermocouple monitoring points**
 - **279 (expandable) temperature monitoring points requested.**

System Proposed, page 2

- **PLC based temperature control of heaters:**
 - Rockwell Control Logix Platform
 - Networking
 - Control Net for PLC I/O and Local Programming/Control
 - TCP/IP interface to Central I&C for data exchange. May use Rockwell software. **TBD**
 - Ethernet/IP network for Remote system control operator interfaces.
 - Software
 - RSLogix 5000 PLC programming software. PC platform
 - RSView32 or SE MMI software---**TBD** . PC operator interface.

System Proposed, page 3

- **Heater 120VAC control:**

- Zero crossing Time Pulsed Output (TPO) solid state relay supplies variable 120VAC pulse train to heater.

- TPO chosen to minimize RFI to diagnostics.

- Phased output SSR's are noisy (i.e.. Standard lighting dimmers)

- Heater power limited by Variac.
- Secondary SSR protects for thermal runaway (shorted TPO control SSR).
- One or more thermocouples provide feedback for each heating zone PID loop.
 - Failed TC sets alarm, notifies operator and removes TC for heating zone mix allowing conditional heater zone control.

Sensor Specifications

- **Thermocouples:**
 - Ref: NCSX-PRL-12-003-00
 - **Type-E, Isolated, electrically floating junction Type-E, Isolated, electrically floating junction.**
 - Similar to type Omega XCIB-E-4-3-10.

- **Heaters:**
 - **Manufacture: BriskHeat**
 - **BIH series tapes are constant resistance type.**
 - *Custom BIH Style Heating Tape: 1/2" W X 10 Ft. L, non-magnetic.*
 - **Heavy Insulated Heating Tape, 520 Total Watts, 24" Leads Same End, Split Plug, 120 Volt.**
 - *Custom BIH Style Heating Tape: 1/2" W X 6 Ft. L, non-magnetic.*
 - **Heavy Insulated Heating Tape, 310 Total Watts, 24" Leads Same End, Split Plug, 120 Volt**

Control I/O M & S Costs

I/O M&S Total = \$211,262

Staffing – Resources to be assigned by PPPL

Cost Estimate Risks

Uncertainty of the Estimate

Design Maturity Medium

Design Complexity Low

The design is straight forward, and uses industry standard components but is a conceptual design at this point.

Risk Mitigation

MDL built a prototype of the Heater and TC controller system (driver and feedback control) and installed it as a furnace controller, with good results.

NCSX Heater and Thermocouple -Instrumentation and Control

Updated 10/25/07

- Task
- Requirements
- System Proposed
- Configuration
- Component details
- AC power requirements
- M&S and Labor cost details
- Total Cost (M&S and Labor)

Tasks

- **Provide resistance heating temperature control system to maintain the NCSX inner port extension wall temperatures during standby and bake out operation.**
 - 114 heating control zones (channels) requested.
 - Type E Thermocouples specified for feedback element (One or more thermocouples used per zone).
- **Monitor temperatures of the Vacuum Vessel body and port extensions during standby and bake out operation.**
 - 279 (expandable) temperature monitoring points requested.
 - Type E Thermocouples specified.
- **Send temperature data to Central I & C for archival and interface to other disciplines.**

Requirements-1

- **Extract from ICD-125-001 “Vacuum Vessel Local Thermocouples”**

- Thermocouples shall be provided to monitor the VV temperature during standby and bake out operation.
- Provisions must be provided by WBS 171 and WBS 12 for future hookup of the additional thermocouples, i.e. connectors at the cryostat and expansion capability at the signal conditioner interface.
- WBS 12 will be responsible for overall design of the system including choice and location of components, mounting provisions, lead routing, signal conditioning, and electrical isolation.
- WBS 12 will be responsible for coordination of the thermocouple design with the other **interfacing disciplines (WBS 171 and WBS 5)**.

Criteria

- Thermocouples will be operated in a range from room temperature to 375 C
- The **thermocouple junctions will insulated from the VV**.
 - Ray G comment: Need thermocouple Isolation/Standoff specification. TBD
- The **leads will be insulated from all structure including the VV and Cryostat**.
- The **signal conditioners will be of the isolated type** to prevent ground loop currents. Additionally, the instrument cabinet will be isolated from ground by insulation and isolation transformers.

Thermocouple Type

- Similar to type Omega XCIB-K-4-3-X
- Inconel Overbraided , Type E, Bolted connection, **Insulated junction**.

Signal Conditioners

- Isolated type, **93** required per field period (**279** total), expandable to 120 per field period.

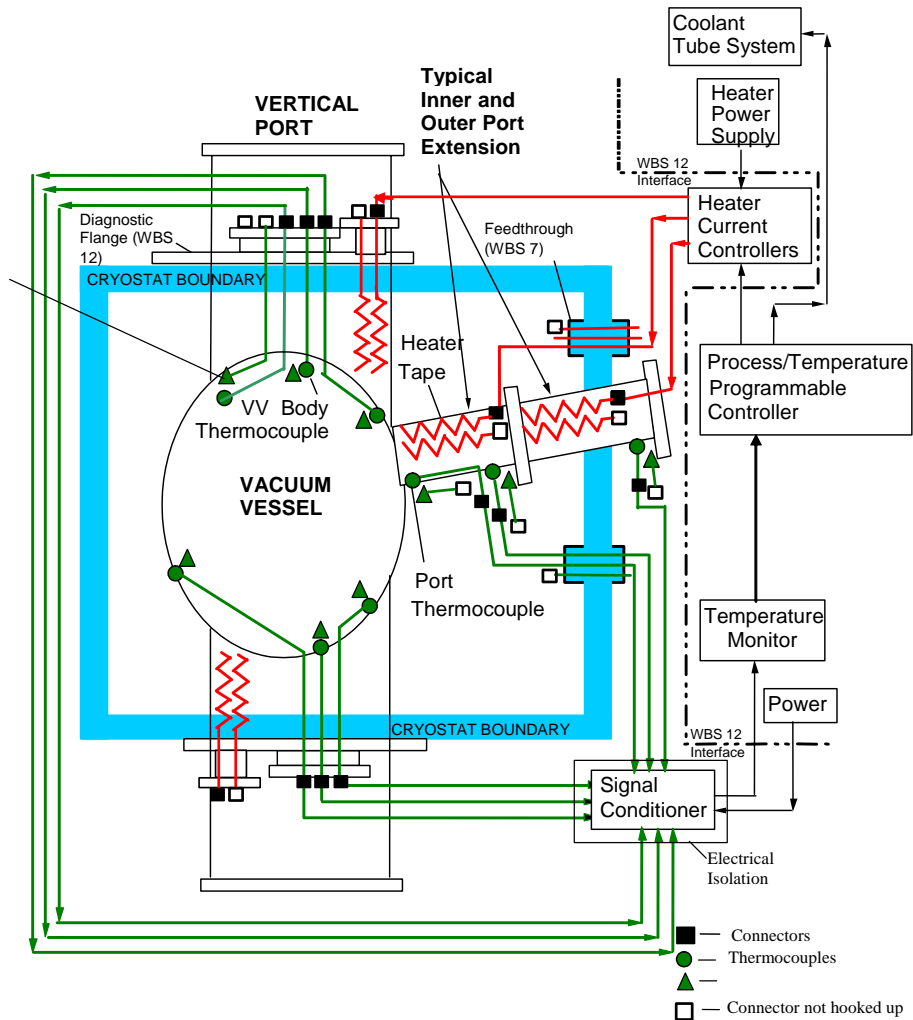

Requirements-1.1

- Extract from ICD-125-001 “Vacuum Vessel Local Thermocouples”

VACUUM VESSEL TEMPERATURE CONTROL

plg 4/08/05

Interface Block Diagrams:

7/7/2008

R.Gernhardt

Requirements-2

- **Extract from ICD-123-4-5-0001 “Vacuum Vessel Port Resistance Heaters”**

- The Vacuum Vessel (VV) utilizes inner and outer port extensions which project through the Modular Coil (MC) shell structure and the Cryostat wall. The port extension walls within the cryostat are electrically heated by resistance heaters which are attached to the port walls and are covered by the port insulation wrap.
- The leads from the power panel to the heaters shall be the responsibility of WBS 12. **WBS 5 shall receive and archive temperature signals from WBS 12.**

Installation Information:

- Each of the inner port extensions is provided with a minimum of one primary and one redundant (backup) electrical resistance heater tape mounted to their surface. The vertical ports (port 12) and large non-circular ports (port 4) will each be provided with four sets of heaters (plus backups). The port extension heater tape hookup interfaces shall be located outside the MC structure, at the inner port flanges. The port 12 heater tape hookup interface shall be at the port 12 diagnostic interface flange.
- The interfacing electrical system must be **capable of upgrade to provide power to a similar system of heaters on the outer extensions**, even though they are not utilized in initial operation. For purpose of assigning interface responsibility, the WBS 4 responsibility shall end at the power panel.
- The **heaters must be electrically isolated from the VV** and its structure. WBS 121 is responsible for the design of the inner port extension heaters, their mounting provisions, the power controllers, temperature sensors, and signal conditioning. The leads from the power panel to the heaters shall be the responsibility of WBS 12.
 - Ray G comment: Need Heater Isolation/Standoff specification. TBD
- **Each heater must be capable of continuous variable operation from zero output to a maximum of 200 watts.** The expected nominal operating level is 50-100 watts. The heaters must be capable of continuous operation at 350 C.

Requirements-3

Requirements-4

- **Extract from ICD-123-64-0001-00 “Cooling/heating requirements ”**
 - **Description of Interface:** The Vacuum Vessel Subassembly (VVSA) exterior surface includes tubes which circulate helium gas to provide heating during bake out of the vacuum vessel and during idle periods when the vacuum vessel is on standby. The helium gas provides cooling of the vessel after operational shots. This ICD defines the operational parameters for the pressurized helium supplied by WBS 64 and defines the requirements for the hookup interface between WBS 123 and WBS 64.
- **Installation/Operation Information:**
 - The port extensions are independently heated by resistance heaters during baking and idle operation.

System Proposed 1

- Provides for:
 - 120 Channels of Active Heater Temperature Control Zones
 - 114 heating control zones (channels) requested.
 - 282 Channels of Thermocouple monitoring points
 - 279 (expandable) temperature monitoring points requested.

System Proposed 2

- PLC based temperature control of heaters:
 - Rockwell Control Logix Platform
 - Fully-redundant controller architecture provides bumpless switchover and high availability
 - Available but not proposed for this system
 - Widest range of communication options and analog, digital and specialty I/O.
 - Select ControlLogix products are TUV-certified for use in SIL 2 applications.
 - Isolated differential Thermocouple I/O modules. 282 channels available-expandable.
 - 3250 VDC for 60 sec user to backplane, 1900 VDC for 60 sec channel to channel.
 - DIN rail terminal block interfaces to Thermocouple field wiring
 - Auto-detects T/C failures. PLC logic programming for heater control fault protection.
 - Networking
 - Control Net for PLC I/O and Local Programming/Control
 - Multiple processors can access common I/O.
 - Offers backup control to remote TCP/IP network.
 - TCP/IP interface to Central I&C for data exchange. May use Rockwell software.TBD
 - Ethernet/IP network for Remote system control operator interfaces.
 - Software
 - RSLogix 5000 PLC programming software. PC platform
 - PID temperature control instructions.
 - RSView32 or SE MMI software---TBD . PC operator interface.

System Proposed 3

- Heater 120VAC control:

- Zero crossing Time Pulsed Output (TPO) solid state relay supplies variable 120VAC pulse train to heater.

- TPO chosen to minimize RFI to diagnostics.

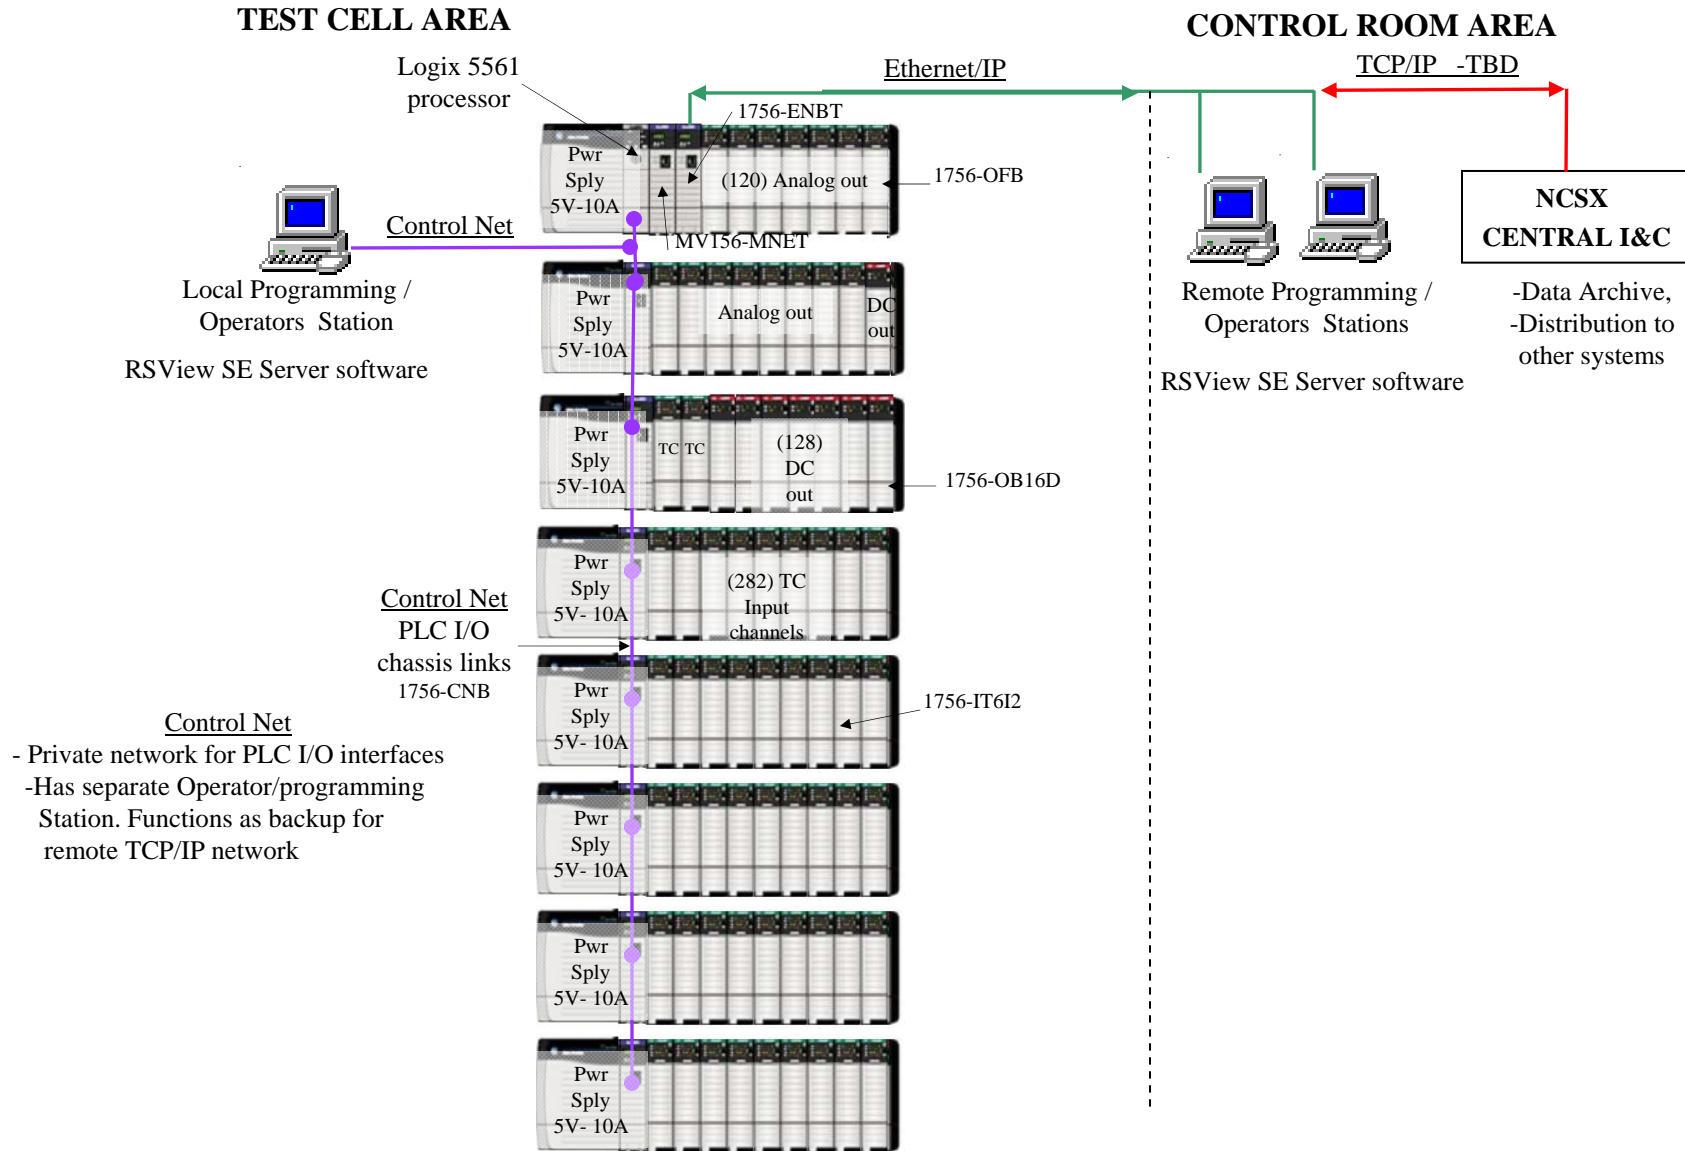

- Phased output SSR's are noisy (i.e.. Standard lighting dimmers)

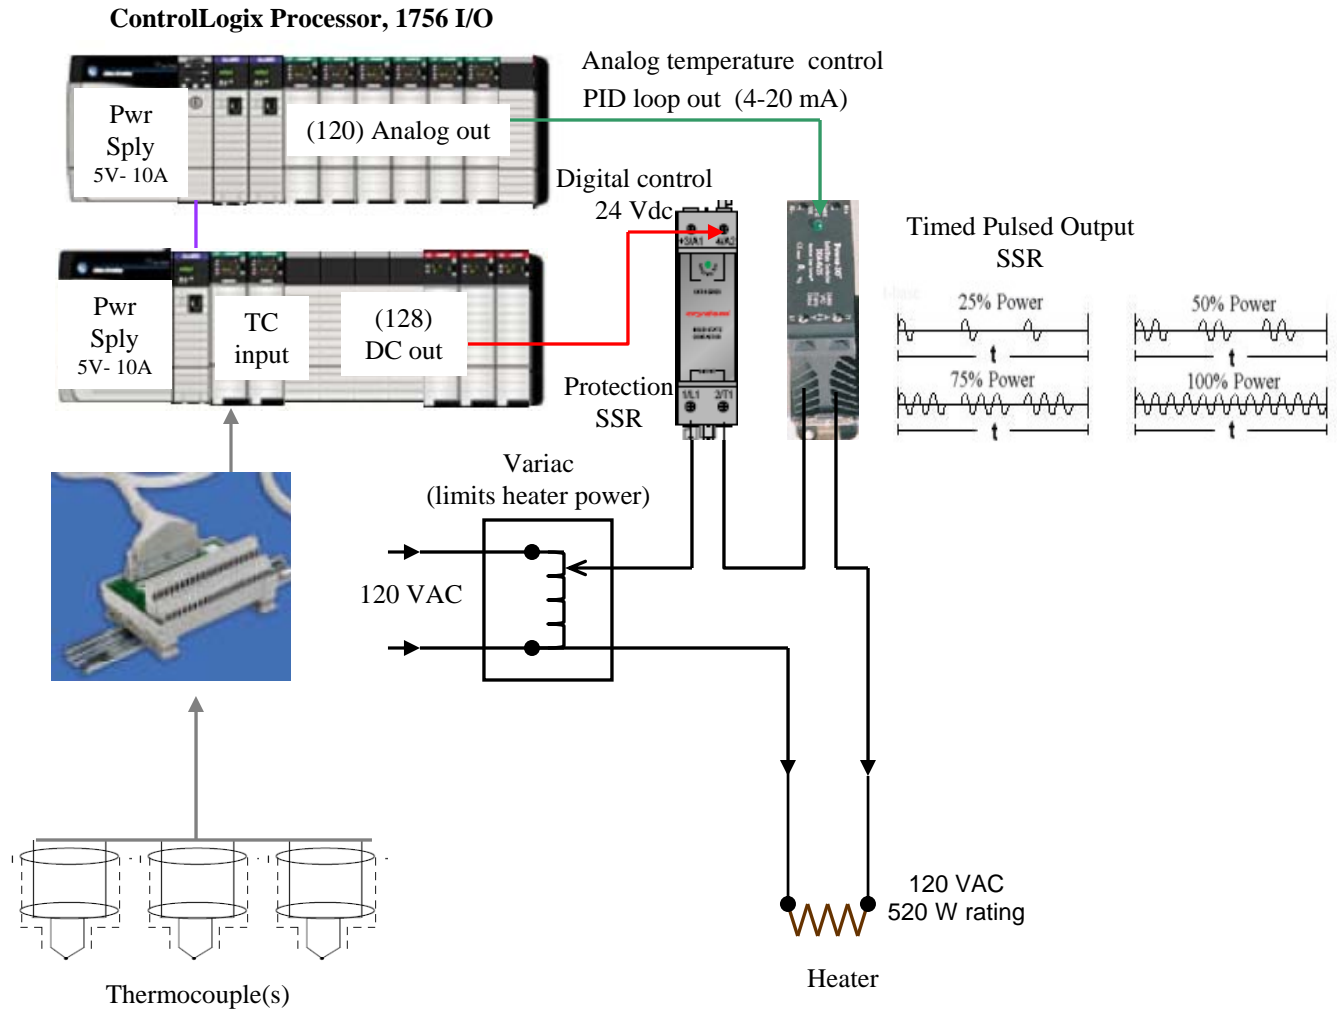

- Heater power limited by Variac.
- Secondary SSR protects for thermal runaway (shorted TPO control SSR).
- One or more thermocouples provide feedback for each heating zone PID loop.
 - Failed TC sets alarm, notifies operator and removes TC for heating zone mix allowing conditional heater zone control.

Rack Layouts

Sensor Specifications

- Thermocouples:
 - Ref: NCSX-PRL-12-003-00
 - Type-E, Isolated, electrically floating junction Type-E, Isolated, electrically floating junction.
 - The TC shall be covered by a single layer braided jacket and fitted with a junction end fitting with holes which permit attachment with # 6 screws.
 - Similar to type Omega XCIB-E-4-3-10.
- Heaters:
 - Manufacture: BriskHeat
 - BH tech comment: “BIH series tapes are constant resistance type. Same R at full temp as at ambient turn on”.
 - **Custom BIH Style Heating Tape:** ½” W X 10 Ft. L, non-magnetic.
 - Heavy Insulated Heating Tape, **520 Total Watts**, 24” Leads Same End, Split Plug, 120 Volt.
 - **Custom BIH Style Heating Tape:** ½” W X 6 Ft. L, non-magnetic.
 - Heavy Insulated Heating Tape, **310 Total Watts**, 24” Leads Same End, Split Plug, 120 Volt

Thermocouple I/O

ControlLogix Enhanced Thermocouple Input Module

Catalog Number 1756-IT6I2

Specifications

| | |
|-----------------------------------|--|
| Cat. No. | 1756-IT6I2 |
| Number of Inputs | 6 individually isolated channels |
| Module Location | 1756 ControlLogix Chassis |
| Backplane Current (mA) at 24V | 120 mA |
| Backplane Current (mA) at 5V | 200 mA |
| Backplane Power | 3.9 W |
| Power Dissipation, Max. | 3.9W |
| Thermal Dissipation, Max. | 13.3 BTU/hr. |
| Input Signal Range | -12mV to +78mV (1.4µV per bit) -12mV to +30mV (0.7µV per bit – high resolution range) |
| Supported Thermocouple Types | B, E, J, K, R, S, T, N, C, D, L (TXK/XX) |
| Thermocouple Linearization | ITS-90 |
| Input Resolution, Bits | 16 bits (1.4µV/bit – Typical; 0.7µV/bit – High resolution range) |
| Data Format | Left justified, 2s complement – Integer mode IEEE 32 bit – Floating point mode |
| Input Impedance | > 10 MΩ |
| Open Circuit Detection Time | Positive full scale reading within 2 s |
| Overvoltage Protection | 120V ac/dc maximum |
| Noise Rejection, Normal Mode | 60 dB at 60 Hz ⁽²⁾ |
| Noise Rejection, Common Mode | 160 dB minimum, tested at 600V ac/60Hz applied with 100 ohms differential resistance |
| Channel Bandwidth | 15 Hz ⁽²⁾ |
| Settling Time to 5% of Full Scale | < 80 ms ⁽²⁾ |
| Module Conversion Method | Sigma-Delta |

| | |
|---|--|
| Isolation voltage (continuous-voltage withstand rating) | 250 V user to backplane 250 V channel to channel Tested to withstand 3250V dc for 60 seconds user to backplane Tested to withstand 1900V dc for 60 seconds channel to channel |
| Thermocouple Temperature/Millivolt Input Range | -12 to +78mV range -12 to +30mV range |
| Thermocouple Type B | 300...1820 °C full range 572...3308 °F |

| Calibrated Accuracy, Typical | 0.05% of full range at 25 °C |
| Calibrated Accuracy, Worst case | Better than 0.1% of full range at 25 °C ⁽³⁾ |
| Calibration Interval | 12 months |
| Accuracy, Local Cold Junction Sensor | ± 0.3 °C |
| Accuracy, Remote Cold Junction Sensor | ± 0.3 °C |
| Input Offset Drift with Temperature | 0.5 µV/ °C |
| Gain Drift with Temperature, Nom. | 15 ppm/ °C 1.4 µV/ °C for -12...+78 mV range 0.6 µV/ °C for -12...+30 mV range |
| Gain Drift with Temperature, Max. | 25 ppm/ °C 2.3 µV/ °C for -12...+78 mV range 1.1 µV/ °C for -12...+30 mV range |
| Module Error over Full Temperature Range | 0.15% of temperature range |
| Module Scan Time for all Channels (Sample Rate) | 25ms minimum – Floating point mode (millivolt) 50ms minimum – Floating point mode (temperature linearization) 10ms minimum – Integer (millivolt) |

CRYDOM SSR (protection relay)

crydom™

Series CKR240
10-30Amp • 240 Vac • AC OUTPUT

- SCR Output
- 10A, 20A & 30A Models
- Ground Terminal Included
- Zero Voltage and Random Turn-On Switching
- Low Leakage
- Integral Heatsink (22.5 mm)
- DIN Rail & Panel Mount
- Status Indicating LED
- DC or AC Control
- Integrated Overvoltage Protection by Automatic Self Turn-On (Suffix P Option)

The Series CKR Solid State Relays utilize Crydom's proprietary thermal management technology providing a compact and efficient design. Built-in DIN Rail attachment, easy-to-use Box Clamp type terminals and integral heat sinking complete the package. This compact new design offers up to 30Arms in ambient temperatures of 25°C.

Manufactured in Crydom's ISO 9001 Certified facility for optimum product performance and reliability.

| Weight: (typical) | 10 oz. (280g) |
| Encapsulation: | Thermally Conductive Epoxy |
| Terminals: | Box Clamp Type |
| Maximum Wire Size: | AWG #10 (3mm) |
| Recommended Terminal Screw Torque Range: | 5.0-6.0 in lb (0.6-0.7Nm) |
| Min. Side by Side Spacing | 0.8 inch (20mm) |

CURRENT DERATING CURVES

MECHANICAL SPECIFICATIONS

All dimensions are in inches (millimeters)

AVAILABLE OPTIONS

- E** 24 Vac Input (18-36 Vac)
Example: **CKRA2410E**
- P** Internal Overvoltage Protection. Relay Will Self Trigger Between 450-600 Vpk. Not Suitable For Capacitive Loads. Example: **CKRD2410P** (AC & DC Control)
- 10** Random Turn-On (AC & DC Control) Phase Controllable (DC Control) Example: **CKRD2410-10**

Power IO SSR (analog drive relay)

POWER-IO™

Intelligent Automation I/O Products

4-20mA activated, single phase, 25 or 40 amp, din rail contactor

- Accepts a 4-20mA analog process input and provides a high speed, time proportional AC output (TPO)
- Permits a PLC, PC, DCS or other control system to supply a TPO without any software programming or intensive CPU calculations of variable on time vs off time.
- Output cycle time ("ON" time + "OFF" time) = 0.5 second. Output resolution is one half of one sinewave (8.3 msec for 60 hz applications).

For example, when the POWER-IO unit is used to control an electric heater, band heater, heat sealing bar, etc:

- 4mA = 0% = heater is off
- 12mA = 50% = heater is ON for 250 msec, OFF for 250 msec, ON for 1/4 second, OFF for 1/4 second...
- 16mA = 75% = heater is ON for 375 msec, Off for 125 msec, ON for 375 msec...
- 17.5mA = 84.375% = heater is ON for 422 msec, Off for 88 msec, ON for 422 msec...
- 20mA = 100% = heater is ON

Note: Rapid pulsing of the heaters provides the most precise temperature control, PLUS it dramatically increases the life of the heaters due to a reduction in the thermal stress of expansion and contraction.

Features

- Maximum Surge Survival™ technology -- triple layer, voltage surge protection
- Green LED for input status
- Thermally optimized heat sink permits edge-to-edge installations on a din rail
- Built-in snubber circuit
- Zero crossing activation -- low EMI, low noise to nearby electronics
- Internal 50A thyristors for high inrush capability

- 4000 volt isolation, 1400 blocking voltage
- 1000 volt per microsecond immunity
- Highest thermal efficiency -- less than 1.2 watts dissipated per amp switched.
- UL, CSA, CE
- Industry standard A1, A2, L1, T1 terminal numbers
- High density design permits more amps per square inch

Specifications

| Part Number | Line Voltage Range (VAC) | Load Current Range (A RMS) | Max Voltage Drop at 20mA |
|-----------------------|---|----------------------------|--------------------------|
| DC activated | | | |
| DMA-6V25 | 24-660 | .10-25 | 6VDC |
| DMA-6V40 | 24-660 | .10-40 | 6VDC |
| Off-State dv/dt | 1000 v/μs | | |
| Isolation | 4000 volts | | |
| I ² T fuse | 50A or less, for example: Bussman FWP50A14F, FWC32A10F, FWC20A10F. Ferraz B093910, M330015, K330013 | | |
| Turn-on time | <8.3 ms at 60hz | | |
| Turn-off time | <8.3 ms at 60hz | | |
| Terminals | Will accept #24-#10 AWG wire. Torque: 7-9 inch lbs. | | |

Variac

Newark InOne Part No.: **83F7131**
Manufacturer: **STACO ENERGY PRODUCTS**

Manufacturer Part No.: **511**
Description: **Variable Transformer**
Supply Voltage:120V; Power Rating:0.6kVA; Number of Phases:Single; Leaded Process Compatible:No; Current Rating:5A; Peak Reflow Compatible (260 C):No; Output Voltage Max:120VAC RoHS Compliant: No

AC Power estimate

- 5 Equipment racks required
 - PLC Chassis rack 1
 - 1 Circuit, 120VAC @ 20 Amp
 - PLC Chassis rack 2
 - 1 Circuit, 120VAC @ 20 Amp
 - Heater Drive Rack 3
 - 1 Circuit, 120VAC @ 20 Amp
 - Heater Drive Rack 4
 - 1 Circuit, 120VAC @ 20 Amp
 - Heater Drive Rack 5
 - 1 Circuit, 120VAC @ 20 Amp
- Heater AC source power
 - If sized for max heater rating 520 W.
120VAC @ 520 Amps required.
 - $520\text{W}/120\text{VAC} = 4.33\text{A/htr}$
 - $120\text{ htr} \times 4.33\text{A} = \underline{\text{Requires 520 A}}$
 - If sized for specified heater operation, 200 W continuous.
120VAC @ 200 Amp required.
 - $200\text{W}/120\text{VAC} = 1.66\text{ A/htr}$
 - $120\text{ htr} \times 1.66\text{A} = \underline{\text{Requires 200 A}}$
 - **Providing circuits for 120VAC @ 360A continuous**
