

NCSX June 2007 ETC

TABLE IV - Uncertainty of Estimate and Residual Risk Assessment

WBS Number: 135											
WBS Title: Central Solenoid Support Structure											
Job Number: 1353											
Job Title: CS Support Structure Procurements											
Job Manager: Fred Dahlgren											
Uncertainty of the Estimate											
		<u>High</u>	<u>Medium</u>	<u>Low</u>	Uncertainty Range (%)	<u>Comments/Other Considerations</u>					
	Design Maturity	X			-5%/+10%	Design complete					
	Design Complexity			X		Simple weldments					
Other uncertainties not considered:											
(1) Material cost escalation higher than predicted. Perhaps 10% increase in material costs, but alternate materials are possible. (10% increase in mat'l \$ relatively small, ~1400lbs x \$3 = 4.2k\$ @)											
(2) Fabrication delays due to material availability. Huntington has quoted 13 weeks ARO. Alternate vendors possible, but very low consequence since could be assembled as part of last subassembly.											
Note: High/Medium/Low uncertainty assessment from Job Manager. Uncertainty range based on ACEI recommended practice 18R-97 as amended for NCSX.											
Residual Impacts											
								Cost Impact	Schedule Impact		
Job	Risk Description				Likelihood of Occurring	Mitigation Plan	Basis of estimate	Low	High	Low	High
NONE											
Notes:											
[1]	Low cost and schedule impacts are considered the minimum (0-percentile) impacts should the event occur. High cost and schedule impacts are considered the maximum (100-percentile) impacts should the event occur										
[2]	Cost impacts should be entered as man-hours (by demographic) and M&S direct cost under basis of estimate. Cost impacts should NOT include standing army costs which are separately calculated from the schedule impact Project control is responsible for quantifying the low and high cost impacts based on the labor hours and M&S identified										
[3]	The schedule impacts should be entered as the min and max impacts on the critical path. If there is no critical path impact then the schedule entries should be zero.										
[4]	Likelihood of occurrence should be entered consistent with our risk classification methodology, i.e. VL= Very Likely (P>80%), L=Likely (80%>P>40%), U=Unlikely (40%>P>10%), VU=Very Unlikely (P<10%), NC=Non-credible (P<1%)
