NCSX June 2007 ETC TABLE I - DESIGN LABOR

WBS Number: 22

WBS Title: Vacuum Pumping System

Job Number: 2201

Job Title: Vacuum Pumping System

Job Manager: Bill Blanchard

Description:

The proposed design consists of a high vacuum system which is manually operated and includes an isolation valve, a vertical pumpduct on a lower P12 port cover and one 1500 I/s TMP. The TMP will be backed by an existing booster mechanical pump system. The system will also contain one unshielded RGA and one ion gauge with and a valved access port for initially roughing down the vacuum vessel.

Basis of Estimate

This is a relatively simple vacuum pumping system that will utilize major components (TMP, isolation valves, booster and mechnical nump) already at PPPL. Estimate based on prior experience on similar systems (e.g., NSTX), adjusted for the simplicity of this system. nput from experienced engineers/personnel familar with specific parts of this scope was def or estimates. Includes design activities, nome P&ID drawings, weld drawings, fab drawings, calculations, two reviews (PDR & FDR), oversight and purchasing of components. The system should have an approximate pumping speed of 700 l/s for attaining 4e-7 Torr or less after the vacuum vessel has been baked put and the surfaces well conditioned.

M&S includes standard cabling, raceways, conduits, etc. For VPS M&S includes piping and other miscellaneous items. Major components available from legacy equipment.

This effort includes both fabrication/welding/assembly, installation, oversight, leak checking of the subsystems, installation procedure, efurbishmnet of legascy equipment as required and initial operation and testing.
